                                                                                                                                                                                                                                                     for
                                                                                                                                                                          designated
                                                                                                                                                                  The present sequence represents an avian EPH receptor ligand designated Elf-1. This ligand can bind to both mek-4 and sek-AP. Elf-1 is a tyrosine kinase ligand, which is linked to the membrane through a phosphatidylinositol linkage. It shares some homology to 2 other EPH receptor ligands, B61 and LERK-2. The Elf-1 protein modulates proliferation, differentiation and survival of EPH receptor-expressing cells by stimulating or antagonising intracellular signalling mediated by the EPH receptor. Typical of many potential applications are increasing survival of neuronal cells in culture (e.g. where intended itransplantation), also therapeutically in increase neuron survival (e.g. treatment of Alzheimer's or Parkinson's diseases), to prevent nervous system and lymphatic tumours, to induce differentiation of hepatocytes to form an artificial liver, to induce cartilage and bone

Human AL-1 (AAR97854) neurotrophic factor is a ligand for eph-related tyrosine kinase receptor REK7 (AAR97853). Its amino acid sequence was deduced from a cDNA clone (AAT18897) isolated from a human foetal brain cDNA library. Recombinant, mature AL-1 can be produced in transformed host cells. It may be useful in promoting the development, maintenance or regeneration of neurons in vivo, and can be utilised in methods for the diagnosis and/or treatment of neurological disorders. It can also be used to promote or enhance angiogenesis. Antagonists and agonists of AL-1, as well as antibodies raised against AL-1, also have therapeutic applns.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          125

Lerk-7 is predicted to be anchored to the cell surface via glycosyl-phosphatidylinositol (GPI) linkage. A GPI anchor attaches to the exposed C-terminal amino acid of the processed mature protein, usually after cleavage upstream, often about 10-12 amino acids, of the N-termino of the hydrophobic domain. Lerk-7 coding sequence (AAT32699) was isolated using a probe derived from the murine Lerk-6 DNA (AAT32700). The Lerk-7 gene and protein can be used for studying the role of Lerk-7 in conjunction with elk, hek and eck receptors. They can also be used for delivering diagnostic or therapeutic agents to cells, e.g. cancer cells. The Lerk-7 proteins can also exhibit neuroprotective or neurotrophic properties and can be used to treat neural tissue disorders.

Human HEK4 binding protein (HEK4 BP) (AAW00035) binds to and activates HEK4 and ECK receptors. Its amino acid sequence was deduced from a cDNA clone (AAT34292) isolated from a human placenta cDNA library. Expression vectors and host cells can be used for the prodn. of biologically active HEK BP. It is useful for modulating the growth and/or differentiation of EPH sub-family receptor-bearing cells, esp. in liver, kidney, lung, skin or neural tissues. It can be used to treat neural system disorders and in the regeneration of
                                                                         117
                                                                                                                            173

A fragment of murine Lerk-6 DNA was isolated by PCR for use a probe for a human Lerk-6 homologue. The probe however led to the identification of a human Lerk-7 gene (see AAT32699). The Lerk-7 gene
                                                                                      Gaps

and protein can be used for studying the role of Lerk-7 in conjunction with elk, hek and eck receptors. They can also be used for delivering diagnostic or therapeutic agents to cells, e.g. cancer cells. The Lerk-7 proteins can also exhibit neuroprotective or neurotrophic properties and can be used to treat neural tissue disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The LERK-6 polypeptide encoded can be used to isolate cells expressing hek/elk cell surface receptors, or to measure the biological activity of such receptors. The protein may also be used as a delivery agent, taking diagnostic and therapeutic agents to cells expressing such receptors. LERK-6 can also be used as a tissue culture reagent to enhance the viability or prolong the lifespan of the neurons. Neural tissue disorders and injuries may be treated by contact with the polypeptide.

The B1 protein sequence was deduced from the cDNA sequence obtd. by screening a cDNA library from human umbilical vein endothelial cells with radiolabelled cDNA fragments derived from the 5' end of B61 DNA.

The B1 protein has 205 residues (24 kD) comprising a signal sequence and hydrophobic N- and C- terminal regions. The B61 gene is involved in early inflammatory response and serves as a marker. It may be detected by probes or by antibody-based immunoassay of biological fluids such as plasma, CSF or urine. These assays make it possible to predict a worsening in a disease process and allow the quantitative assessment of the magnitude of the inflammatory response. This information will allow the disease process and appropriate therapy, thereby shortening the disease process and limiting the patient's exposure to anti-inflammatory/immuno-suppressive therapy. B61 induction is rapid and profound, hence
                                                                                                                      81
                                                                                                                                                                                                                                                                                                                                                                    induction;

                                                                                                      The DNA encodes an Eph transmembrane tyrosine kinase family designated Ef1-2. Ef1-2 is useful for identifying other ligareth-1, -2, -3, Eck and Elk receptors. The ligands are useful promoting a differential function and/or influencing the phersuch as growth and/or proliferation, of receptor bearing cellmay be used in the diagnosis, and treatment of neurological contracts.

                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequence is that of a clone encoding hek-L protein, a protein that can bind hek (a cell surface receptor tyrosine kinase). Hek-L is the first known ligand for hek and can be used to study cellular processes regulated by hek (which may be involved in tumorigenesis)
New isolated DNA encoding hek-L protein or its fusion products useful as assay reagent or for carrying therapeutic and diagnostic compounds to leukaemia cells.
                                                                                                                                                                                                        tumorigenesis

AAA00010 to AAA02716 represent polynucleotides isolated from cDNA
libraries constructed from human colon cancer cell lines. The present
invention also describes a method of detecting differentially expressed
genes correlated with a cancerous state of a mammalian cell, comprising
detecting at least one differentially expressed gene product in a test
sample derived from a cell suspected of being cancerous, where detection
of the differentially expressed gene product is correlated with a
cancerous state of the cell from which the test sample was derived.
The polynucleotides sequences can be used in a method for detecting
differentially expressed genes correlated with a cancerous state of a
mammalian cell. The polynucleotides can also be used as probes for
detecting and mapping related genes. They can be used in diagnosis and
prognosis of diseases and disorders (e.g. identification of
prognosis of diseases and disorders (e.g. identification of
pre-metastatic or metastatic cancerous states, stages of cancer, or
responsiveness of cancer to therapy). This is particularly for breast
cancer, oestrogen receptor-positive breast cancer, oestrogen receptoroegative breast cancer, lung cancer, and colon cancer.

AAA00010 to AAA02716 represent polynucleotides isolated from cDNA libraries constructed from human colon cancer cell lines. The present invention also describes a method of detecting differentially expressed genes correlated with a cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample derived from a cell suspected of being cancerous, where detection of the differentially expressed gene product is correlated with a cancerous state of the cell from which the test sample was derived. The polynucleotides sequences can be used in a method for detecting differentially expressed genes correlated with a cancerous state of a mammalian cell. The polynucleotides can also be used as probes for detecting and mapping related genes. They can be used in diagnosis and prognosis of diseases and disorders (e.g. identification of

An ORF has been identified within the sequence. The 5' ESTS were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTS are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTS are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTS are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion

The invention relates murine and human LERK-6 polypeptides that bind to hek/elk receptors. Host cells transfected or transformed with vectors comprising the LERK-6 nucleic acid sequences are used for the recombinant production of the proteins. LERK-6 polypeptides may be useful in the enhancement, stimulation, proliferation or growth of cells expressing the hek or elk receptor. The ligand and receptor complex may be involved in treating disorders of neural tissue such as injury or neurological diseases, either chronic or acute. LERK-6 may be employed in treating neural diseases, either chronic or acute. LERK-6 may be employed in treating consuctive conditions where there is neural death, excitotoxicity. In addition, they may be administered to a mammal to exert a trophic effect on neural tissue. They can also be used as reagents for those conducting quality assurance studies e.g. to monitor shelf life and stability of elk protein under different conditions. The polypeptides can also be used as carriers for delivering agents attached to cells bearing the elk or hek cell surface receptor. It was obtd. from a day-3 chick embryo cDNA library using mouse Elf-1 cDNA (see AAT15008) as probe. The cDNA can be used for the product recombinant Elf-1, in the breeding of transgenic animals, for the design of diagnostic probes, and for gene (or antisense) therapy of cellular and tissue disorders.

A mouse cDNA clone (AAT15008) codes for a novel EPH receptor ligand, Elf-1 (AAR94766), involved in the formation and maintenance of ordered spatial arrangements of differentiated tissue. It was obtd. from an embryo mid- and hind-brain cDNA expression library using a receptor affinity probe technique with mek4-AP and sek-AP (AP = alkaline phosphatase) reagents. The cDNA is used for the prodn. of recombinant Elf-1, in the breeding of transgenic animals, for the design of diagnostic probes, and for gene (or antisense) therapy of cellular and tissue disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Murine and chicken EPH receptor ligand, Elf-1 - useful in diagnosis and treatment of disorders associated with the Elf-1 gene, e.g.

                                                                                                                                                                                                                                                                                 for
                                                                                                                                                                             The present sequence encodes an avian EPH receptor ligand designated Elf-1. This ligand can bind to both mek-4 and sek-AP. Elf-1 is a tyrosine kinase ligand, which is linked to the membrane through a phosphatidylinositol linkage. It shares some homology to 2 other EPH receptor ligands, B61 and LERK-2. The Elf-1 protein modulates proliferation, differentiation and survival of EPH receptor-expressing cells by stimulating or antagonising intracellular signalling mediated by the EPH receptor. Typical of many potential applications are increasing survival of neuronal cells in culture (e.g. where intended itransplantation), also therapeutically in increase neuron survival (e.g. treatment of Alzheimer's or Parkinson's diseases), to prevent nervous system and lymphatic tumours, to induce differentiation of hepatocytes to form an artificial liver, to induce cartilage and bone

The present sequence encodes a mammalian EPH receptor ligand designated Elf-1. This ligand can bind to both mek-4 and sek-AP. Elf-1 is a tyrosine kinase ligand, which is linked to the membrane through a phosphatidylinositol linkage. It shares some homology to 2 other EPH receptor ligands, B61 and LERK-2. The Elf-1 protein modulates proliferation, differentiation and survival of EPH receptor-expressing cells by stimulating or antagonising intracellular signalling mediated by the EPH receptor. Typical of many potential applications are increasing survival of neuronal cells in culture (e.g. where intended for transplantation), also therapeutically in increase neuron survival ce.g. treatment of Alzheimer's or Parkinson's diseases), to prevent nervous system and lymphatic tumours, to induce differentiation of hepatocytes to form an artificial liver, to induce cartilage and bone
                                                                                                                                                                                                                                                                                                                                                                               120

                                                                                                                                                                                                                                                                                                                                                               The LERK-6 polypeptide encoded by this sequence can be used to isolate cells expressing hek/elk cell surface receptors, or to measure the biological activity of such receptors. The protein may also be used as a delivery agent, taking diagnostic and therapeutic agents to cells expressing such receptors. LERK-6 can also be used as a tissue culture reagent to enhance the viability or prolong the lifespan of the neurons. Neural tissue disorders and injuries may be treated by contact with the polypeptide.

The invention relates murine and human LERK-6 polypeptides that bind to hek/elk receptors. Host cells transfected or transformed with vectors comprising the LERK-6 nucleic acid sequences are used for the recombinant production of the proteins. LERK-6 polypeptides may be useful in the enhancement, stimulation, proliferation or growth of cells expressing the hek or elk receptor. The ligand and receptor complex may be involved in neural growth, development and/or maintenance. LERK-6 can be used for treating disorders of neural tissue such as injury or neurological diseases, either chronic or acute. LERK-6 may be employed in treating neurodegenerative conditions where there is neural death, excitotoxicity. In addition, they may be administered to a mammal to exert a trophic effect on neural tissue. They can also be used as reagents for those conducting quality assurance studies e.g. to monitor shelf life and stability of elk protein under different conditions. The polypeptides can also be used as carriers for delivering agents attached to cells bearing the exceptor. The present sequence represents a expansion expansion from human reper.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               A fragment of murine Lerk-6 DNA was isolated by PCR for use as a probe for a human Lerk-6 homologue. The probe however led to the identification of a human Lerk-7 gene (see AAT32699). The Lerk-7 gene and protein can be used for studying the role of Lerk-7 in conjunction with elk, hek and eck receptors. They can also be used for delivering diagnostic or therapeutic agents to cells, e.g. cancer cells. The Lerk-7 proteins can also exhibit neuroprotective or neurotrophic properties and can be used to treat neural tissue disorders.

The protein may also be used as a delivery agent, taking diagnostic and therapeutic agents to cells expressing such receptors. LERK-6 can also be used as a tissue culture reagent to enhance the viability or prolong the lifespan of the neurons. Neural tissue disorders and injuries may be treated by contact with the polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             hek

Host cells transfected or transformed with vectors comprising the LERK-6 nucleic acid sequences are used for the recombinant production of the proteins. LERK-6 polypeptides may be useful in the enhancement, stimulation, proliferation or growth of cells expressing the hek or elk receptor. The ligand and receptor complex may be involved in neural growth, development and/or maintenance. LERK-6 can be used for treating disorders of neural tissue such as injury or neurological diseases, either chronic or acute. LERK-6 may be employed in treating neurodegenerative conditions where there is neural death, excitotoxicity. In addition, they may be administered to a mammal to exert a trophic

effect on neural tissue. They can also be used as reagents for those conducting quality assurance studies e.g. to monitor shelf life and stability of elk protein under different conditions. The polypeptides can also be used as carriers for delivering agents attached to cells bearing the elk or hek cell surface receptor. The present sequence represents a cDNA encoding a murine LERK-6 polypeptide.

NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
NOTE: This is a 'working draft' sequence. It currently consists of 22 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will
                                                                      Center clone name: RP11-498A2

                                                     NOTE: This is a 'working draft' sequence. It currently consists of 66 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                 HTG

Patent No. 5747033
FEBRET INFORMATION:
FAPLICANT: Davis, et al.
TITLE OF INVENTION: METHOD OF ENHANCING THE BIOLOGICAL NUMBER OF SEQUENCES:
CORRESPONDENCES: 8
CORRESPONDENCES: 8
CORRESPONDENCES: 8
CORRESPONDENCES: 8
ADDRESSEE: Regeneron Pharmaceuticals, Inc.
STARE: 177 Old Saw Mill River Road
CITY: Tartycown
STARE: New York
COUNTRY: US.A.
COMPUTER: New York
COUNTRY: US.A.
COMPUTER: IBM PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.30
ATTORNEY/AGDNT INFORMATION:
RESERVATION NUMBER: 32, 143
RESTSTATION NUMBER: 32, 143
RESTSTATION NUMBER: 32, 143
REPERENCE/DOCKET NUMBER: REG 290
TELECOMMUNICATION INFORMATION:
RESERVATION FOR SEO ID NO: 8:
ELECHONE: 914-345-7400
SEQUENCE CHARACTERISTICS:
LENGTH: 1070 base pairs
